I'm a bassist and a dev, so I built a free plugin that gives you studio quality bass tone

I've been recording bass for 15 years and I'm also a coder, so I put both together and built a simple bass plugin that gives premium studio quality without a million settings.

The beta is free. [Check it out here](#) and [download here](#)

Heads up: I built this on a Mac. The Windows installer should work fine, but if it gives you any grief the plugin files are in there too so you can drop them in manually.

Two asks if you try it:

Bugs and requests go on [the repo as an Issue](#) so I can track them, not in the comments

[Quick feedback goes here](#)

Cheers!

EDIT/DISCLAIMER: I used Claude/AI to format and generate the JUCE project scaffolding and propagate the release binaries. All proprietary creative formatting (ie IRs and algorithm) were written by myself pre-repo initiation.

As you already have a disclaimer on the repo maybe also mention it is so generated

The JUCE scaffolding and releases have been generated (or rather linted/formatted and then compiled through CI actions) but the irs and underpinning parts were created by me prior to the repo submission; despite the commit history, I built more of it than Claude - it is based on years of recording samples through various equipment and making my own algorithm.

Curimania • 3d ago

Fair enough but still think it should be mentioned

jameshgordy OP • 3d ago

Sure, I'm open to that, what do you suggest? Blanket statement or just declare what I've used it for?

Genuinely asking as [I've worked in tech 15 years](#) so to me the AI tools are mostly scale and efficiency, not ceding creativity or competency (ie I can describe what is being done, how and why), so disclaimer territory isn't obvious to me

Blank Statement maybe „...was used for juce porting „ or something

I clicked on your website and have a question: What does 'DI' stand for?

Direct Input - so raw signal only the bass essentially. Let me know if any issues!
